Metal-free oil filter elements – comparing seal concepts

Many metal-free MANN-FILTER oil filter elements are designed with foil end caps. For many years, these have provided a successful solution in both the aftermarket and OE sectors. The seal to the relevant matching part in the oil filter housing is achieved through the precisely fitting internal diameter on the end cap (see marking on Fig. 1).

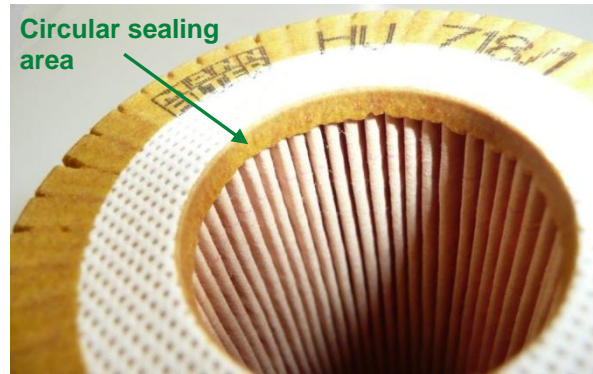

Fig. 1

Other designs are also available, e.g. with plastic end caps which are sealed with a fleece or rubber gasket (see Fig. 2).

Fig. 2

Differences in appearance do not in any way affect the element's function or quality. MANN-FILTER products are always supplied in OE quality, whatever the design.

MANN-FILTER – Perfect parts. Perfect service.
